Accessing your site & Uploading Files:

You can use any FTP client to upload to your site, as well as the server's built-in File Manager. On the control panel, both under "Domain Management" and the 3rd tab at the top, you'll find the File Manager. This allows you to upload or archive what you have already uploaded. It's also handy to execute .tgz files (downloaded CMS, PHP programs & such).

Remember, TeraScape uses Linux as it's operating system. Microsoft databases or .asp.net applications will not function. PHP is far more secure and advanced, and is the standard of some of the biggest, best websites on the internet.

For FTP (File Transfer Protocol):

This information is for wsFTP, Dreamweaver, FileZilla and other ftp or site building clients.

login: your control panel login (in lowercase letters)

pass: your password

server: 123.254.108.246

port: 21 (some programs do not ask for port.)

Alternatively, you can create a separate username for FTP access. Create that under "FTP sub-accounts & choose which folder you want that user to have access to. Default is the entire account, so beware of what access you give to whom.

Creating a new FTP user

Click "Create FTP account" to add a new user. From there, you can select which folders this new user is able to access. If you want your user to only access one of your folders, and be blocked from the rest, use "Custom" and type in the path to the folder or domain name that they should be able to access.

Otherwise, use "Domain" to give this person full access to the domain you want them to be able to access.

FTP Setup - terascape.net

» Home » terascape.net » FTP Setup

Create FTP account	
FTP Username:	<input type="text"/> @terascape.net
Enter password:	<input type="password"/> <input type="button" value="Random"/>
Re-enter Password:	<input type="password"/> Strength: <input type="text"/>
Domain:	<input checked="" type="radio"/> FTP account with the root directory in the domains home directory (one up from the public_html)
FTP:	<input type="radio"/> FTP account with the root directory in the domains public FTP directory
User:	<input type="radio"/> FTP account with the root directory as the users name in the public_html directory
Custom:	<input type="radio"/> <input type="text" value="/home/terascape"/>
<input type="button" value="Create"/>

Databases

Database Management is found under "Databases". Most PHP applications, like Joomla, Drupal, phpBB & such use Databases. Use this to create your database and give yourself Admin privileges for installation purposes.

The screenshot shows the TeraScape Control Panel interface. At the top, there is a navigation bar with links for Home, Webmail, File Manager, Password, and Help. Below this, the main content area is organized into several sections:

- Account Summary:** A sidebar on the left showing system statistics such as Disk Space (147.9MB), Bandwidth (205.10 MB), Domains (4), Databases (3), FTP Accounts (1), Emails (4), Sub-Domains (0), and Pointers (2).
- Account Management:** A central section containing icons for Summary / Statistics, File Manager, phpMyAdmin, Change Password, Login History, Support Center, Server Information, Create/Restore Backups, Password Protected Directories, and DNS Management.
- Email management:** A section on the right containing icons for POP3 E-Mail Accounts, Catch-All E-Mail, Forwarders, Autoresponders, Vacation Messages, Spamassassin Setup, Mailing Lists, SPAM Filters, Webmail: Squirrelmail, and Webmail: RoundCube.
- Domain Management:** A section at the bottom left containing icons for MySQL Management, FTP Management, Subdomain Management, Domain Pointers, Site Redirection, and Domain Setup. A black arrow points to the MySQL Management icon.
- Advanced options:** A section at the bottom right containing icons for SSL Certificates, Cronjobs, Mime Types, Apache Handlers, Custom Error Pages, Installed Perl Modules, MX Records, and Login Keys.

At the bottom of the interface, there is a footer that reads: "DirectAdmin Web Control Panel © 2009 JBMC Software".

To Add a database, click the MySQL Management icon under “Domain Management” & click “Create New Database”.

Add your database on the following fields:

Database Name:

Database Username:

Username Password:

Confirm Password:

Note: Do NOT use the same Username as the database name. If you already have a database Username, you can select "Use Existing" to automatically add the username and password to the new database.

phpMyAdmin

Click on the phpMyAdmin link to access your database and add, repair or delete tables. Alternatively, if you use a program like Navicat, a database management program, you'll have to add a second Access Host. Just enter % & click "Add Host" and your database management program will be able to access your database.

This is a list of allowed access hosts. If you want to access this database from a specific host you need to add the hostname, domain or ip address above. You can use % to allow any host.
